

# Cryptographic Protocols

Winter Semester 2005

5. Homework

15 December 2005

## Exercise 1:

Show that the result on the reduction of number of agents allows us to decide secrecy in the presence of a passive attacker (for unbounded number of sessions and nonces).

## Exercise 2:

Consider the following protocol where  $\oplus$  is the xor operation, and  $S_{ab}$  is a long term secret between  $A$  and  $B$ .

$$\begin{aligned}A &\longrightarrow B : N_a \oplus K_{ab} \\B &\longrightarrow A : N_b \oplus N_a \\A &\longrightarrow B : S_{ab} \oplus N_b\end{aligned}$$

The properties of xor operation are as follows:

$$\begin{aligned}x \oplus (y \oplus z) &=_{xor} (x \oplus y) \oplus z \\x \oplus y &=_{xor} y \oplus x \\x \oplus 0 &=_{xor} x \\x \oplus x &=_{xor} 0\end{aligned}$$

To take into account the xor operation in the intruder deduction problem, we add the following inference rules to the existing rules:

$$\frac{E \vdash m \quad m =_{xor} m'}{E \vdash m'} \qquad \frac{E \vdash m_1 \quad E \vdash m_2}{E \vdash m_1 \oplus m_2}$$

Does the protocol preserve the secrecy of the message  $S_{ab}$ ?
